

EXCEL BIKE SALES DASHBOARD

Analyzing Bike Sales Trends with Data :

A well-structured dashboard can reveal fascinating patterns in consumer behavior. Using Excel, Pivot Tables, and Interactive Slicers, I analyzed the impact of key factors on bike purchases. Here are some valuable insights:

1. Income vs. Bike Purchase Decision

- **Observations on Female Customers:**
 - Average income of females who did **not** purchase a bike: **\$59,210.53**.
 - Average income of females who **purchased** a bike: **\$59,523.81**.
 - **Insight:** Female buyers have a slightly higher average income than non-buyers, but the difference is not significant. This suggests that income may not be a major determining factor in their purchasing decision.
- **Observations on Male Customers:**
 - Average income of males who did **not** purchase a bike: **\$65,000.00**.
 - Average income of males who **purchased** a bike: **\$52,500.00**.
 - **Insight:** Male buyers tend to have a lower income than non-buyers. This may indicate that males with higher incomes prefer other means of transportation over bikes.

2. Age Bracket vs. Bike Purchase Decision

- **Young (0-30 years old):**
 - Very few purchases from this age group.

- **Insight:** Younger people may be less interested in buying bikes, possibly due to financial constraints or preference for other transportation modes.
- **Middle Age (31-54 years old):**
 - Highest number of bike purchases.
 - **Insight:** This age group is the most likely to purchase a bike, possibly due to a stable income and health-conscious commuting choices.
- **Senior (55+ years old):**
 - Sharp decline in bike purchases.
 - **Insight:** Older individuals might prefer more comfortable or motorized transportation options.

3. Commute Distance vs. Bike Purchase Decision

- **0-1 Miles:**
 - Highest number of purchases.
 - **Insight:** Short-distance commuters are more likely to buy bikes, suggesting that bikes are mainly used for nearby travel.
- **1-2 Miles:**
 - Similar numbers of buyers and non-buyers.
 - **Insight:** A neutral distance where other factors (e.g., public transport availability) may influence the decision.
- **2-5 Miles & 5-10 Miles:**
 - Fewer purchases as the commute distance increases.
 - **Insight:** Longer commutes reduce the likelihood of choosing a bike, likely due to comfort and travel time considerations.
- **10+ Miles:**
 - Almost no bike purchases.
 - **Insight:** Biking is not preferred for long distances, as people might choose cars or public transport.

4. Impact of Education on Bike Purchases

- **Bachelor's Degree Holders:**
 - Selected in the filter, meaning focus is on this group.
 - **Insight:** This group may have a significant role in the dataset. Further analysis would be needed to compare with other education levels.

5. Regional Preference

- **Europe, North America, Pacific selected:**
 - Indicates a focus on bike purchase behavior in these regions.

- **Insight:** A regional breakdown could reveal geographic trends. For instance, Europe might show higher bike adoption due to bike-friendly infrastructure.

Key Takeaways

- Conducted an in-depth **data analysis** of bike sales trends using Excel dashboards.
- Analyzed **demographic, financial, and commuting factors** influencing bike purchase decisions.
- Identified key **patterns in income, age, and commute distance** to determine buying behavior.
- Developed **business insights** to help companies target the right customer segments.
